

# AEGIS - Revised Scope Summary

Renaming the Project **AEGIS** -> **ARTEMIS**

---

## 1. Target Audience

ARTEMIS is repositioned from a final-year-student tool to a general assistant for anyone managing a multi-file project on their own machine, including students, freelancers, and developers. The underlying problem is the same across all of them: work spread across many files, resumed repeatedly after gaps in time, with recurring manual tasks in between. The system design does not change across audiences. A user opts a folder in as a workspace, ARTEMIS only accesses what has been shared, and every action requires preview and approval. Only the file types and vocabulary each feature recognizes adjust to the workspace content, for example source files and branches for a developer, or client deliverables for a freelancer.

## 2. Code Assistant

A code assistant is reinstated as Feature 5. It reads source files already present in an opted-in workspace and answers direct questions about them, including explaining errors and identifying likely causes of a failure. Any suggested fix is presented as a diff against the current file. No file is modified until the user approves the change, and an undo option is available afterward. The assistant does not write code independently and does not execute or test code. This keeps the feature within the same approval-based model already used for file organization, rather than introducing a separate, higher-risk category of autonomous action.

## 3. Additional Feature

A sixth feature, a workspace change summary, is proposed for later development. On reopening a workspace, ARTEMIS reports which files changed since the last session and provides a quick diff for each. This reuses data already collected by existing features and requires no new access or permission tier.

Two other ideas were considered and set aside:

- An export feature for sharing workspace context with a teammate or client. This was excluded because it introduces outbound data sharing, which conflicts with the current no-outbound-communication rule.
- A meeting notes capture feature. This was excluded because it requires background audio capture, which conflicts with the system's opt-in, user-shared data model.

## 4. Scope

The first version of the system now consists of five features: session resume, folder organization, multi-document synthesis, repeated-task automation, and the code assistant. The workspace change summary is scheduled as a stretch goal for later iterations, following the same approach already applied to browser-tab tracking. This keeps the addition of new capability deliberate and bounded within the two-semester timeline.
